We've been starting to realise that the amount of hours we spend on this project is extremely inproportional to the time we spend on the other course we are currently studying. Therefore we've decided to not take on 3-4 user stories this sprint, although we did take on one of the heavier ones, namely implementing Time.

The issues with tests complaining about things that not even the lecturer could understand are still very much present in our planning and we have decided that if this last effort doesn't give results, then we'll resort to something less optimal. The possible solution is to abandon the domain of Android JUnit and revert to using just JUnit to test our model. We do have a backup plan to write classes that "test" all the methods we can reach and just printing the results in the log.
