Day 14 since impact

Still no sign of a working test. Though heavy research with the infamous Google search engine, entering error messages and descriptions of what's wrong. No solution seems to be available to resolve the error code:

Test run failed: Test run failed to complete. Expected 1 tests, received 0

The one thing we've found is that there could be an issue in the construction of the test, such that it's bypassed by the Instrumentation, which has been added in the manifest.
_____

Super big, irritating, problem has arisen: when trying to call the method; registerForContexMenu(View) and using findViewById(R.layout.activity_main) as a parameter, we get a nullPointerException. The same goes if we try to use the mainMenu, a menuItem och any other subclass of View. Eclipse doesn't detect any problem, but we can't use the method with any parameter. This efficiently negates the use of a floating context menu.

After this weeks first meeting we decided take on both saving and loading feature and the main log. We also added the new Everbie feature since we reckoned that it wouldn't be to big of a task. We then constructed this weeks sprintlog and expect that we will be able to complete both the sprint and fix some of the problems and error that have occured from the last sprint.
